## 1 Exercise 1

Consider a language  $L = \{ok, a, bad, dab, abba, hi, \varepsilon, acc, duck\}$

(a) Give a possible  $\Sigma$  such at  $L \subseteq \Sigma^*$

$$\Sigma = \{a, b, c, d, h, i, k, o, u\}$$

(b) Why is this only possible  $\Sigma$

Supposing this question is asking why this is the only possible **minimal** alphabet, the answer is that it must contain exactly the set of symbols that appear in the words in  $L$ , and that set is uniquely determined.

(c) Give all words in  $L$  in shortlex order

$$\varepsilon, a, hi, okacc, bad, dab, abba, duck$$

## 2 Exercise 2

Consider the following claims (a) and (b). For each claim, verify whether it is true for arbitrary languages  $L_1 \subseteq \Sigma_1^*, L_2 \subseteq \Sigma_2^*, L_3 \subseteq \Sigma_3^*, L_4 \subseteq \Sigma_4^*$ . If a claim is true, give a proof; if it is not true, give a counterexample with an explanation how the counterexample shows the claim is false.

(a) If  $L_1 \cup L_2 = L_3 \cup L_4$ , then  $\Sigma_1 \cup \Sigma_2 = \Sigma_3 \cup \Sigma_4$

**FALSE.**

Counterexample:

$$\begin{aligned}\Sigma_1 &= \{a, x\}, \Sigma_2 = \{b\}, \Sigma_3 = \{a, y\}, \Sigma_4 = \{b\} \\ L_1 &= \{a\}, L_2 = \{b\}, L_3 = \{a\}, L_4 = \{b\}\end{aligned}$$

$$\begin{aligned}L_1 \cup L_2 &= L_3 \cup L_4 = \{a, b\} \\ \Sigma_1 \cup \Sigma_2 &= \{a, b, x\} \neq \Sigma_3 \cup \Sigma_4 = \{a, b, y\}\end{aligned}$$

(b) If  $L_1 \cup L_2 \subseteq L_3 \cap L_4$ , then  $L_1 L_2 \subseteq L_3 L_4$

**TRUE.**

*Proof.* From the first part of the implication, it follows that every word in  $L_1$  and every word in  $L_2$  is in both  $L_3$  and  $L_4$ , so  $L_1 \subseteq L_3$  and  $L_2 \subseteq L_4$

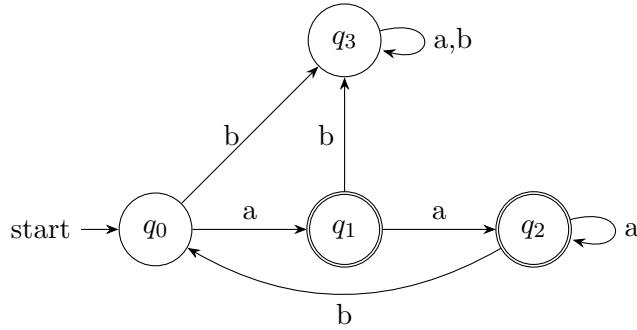

Take an arbitrary word  $w \in L_1L_2$ . By definition of concatenation, we have  $w = xy$  such that  $x \in L_1$  and  $y \in L_2$ . From earlier,  $x \in L_3$  and  $y \in L_4$ . Therefore,  $w = xy \in L_3L_4$ . Since  $w$  is arbitrary, it holds that  $\forall w \in L_1L_2 : w \in L_3L_4$ . So  $L_1L_2 \subseteq L_3L_4$ .  $\square$

### 3 Exercise 3

Suppose we have an alphabet  $\Sigma = \{a, b\}$ . Construct a DFA  $M = (Q, \Sigma, \delta, q_0, F)$  that recognizes the following language  $L \subseteq \Sigma^*$ :

$$L = \{w \mid \text{each } b \text{ in } w \text{ is immediately preceded by at least two } as \text{ and } w \text{ ends with an } a\}$$

(a) Give the transition graph of  $M$ . Use no more than 6 states.

(b) Describe briefly how  $M$  works.

Basically it counts if there's been at least 2  $a$ s before a  $b$ . If not, the word is invalid so we go to a non-accepting state of  $q_3$ , which gets stuck there. If we get a  $b$  in a valid position, we go back to the beginning thing. Also, to check that it ends in  $a$ , only  $q_2$  and  $q_3$  are valid.

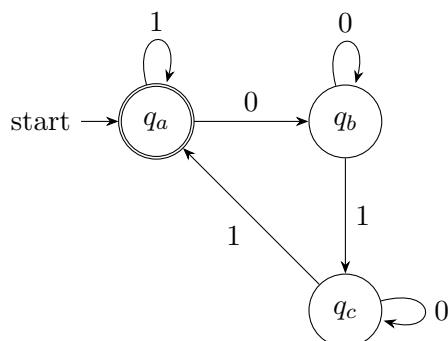

### 4 Exercise 4

Consider the DFA  $D = (\{q_a, q_b, q_c\}, \{0, 1\}, \delta, q_a, \{q_a\})$ , where  $\delta$  is represented using the following

transition table:

	0	1
$q_a$	$q_b$	$q_a$
$q_b$	$q_b$	$q_c$
$q_c$	$q_c$	$q_a$

(a) Give a transition diagram that corresponds to  $D$ .

(b) Give a word  $w$  of length 3 that is not in  $D$  but is in  $D' = (Q, \Sigma, \delta, q_a, F \cup \{q_c\})$

010

(c) Now imagine that we create a DFA  $D'' = (Q \cup Q_2, \Sigma, \delta_1, q_a, F)$ , what do we know about  $\delta_2$ ?

$$\delta_1(q, s) = \begin{cases} \delta(q, s) & \text{if } q \in Q \\ \delta_2(q, s) & \text{else} \end{cases}$$
 for some function  $\delta_2 : Q_2 \times \Sigma \rightarrow Q \cup Q_2$ .  $Q \cap Q_2 = \emptyset$  Every state

in  $Q_2$  must have a transition defined for all inputs, so in our case, they must have a transition for 0 and for 1. So the number of extra transitions is  $2|Q_2|$

(d) Describe as accurately as possible the relation between  $L(D)$  and  $L(D'')$  in terms of  $\subset, \subseteq, =$  relations. Explain your answer.

$$L(D) = L(D'')$$

The starting state of  $D''$  is in  $Q$ , and all transitions in  $\delta$ , which cover all states in  $Q$  always remain in  $Q$ . So therefore, it is impossible for an input to leave  $Q$  and go into  $Q_2$ . Therefore,  $D$  and  $D''$  are basically equivalent, as they have the same set of reachable states and stuff.

## 5 Exercise 5

Consider a modification of the DFA model, called NEFA. The NEFA model is identical to the DFA with the extra requirement that  $q_o \in F$

(a) Is the NEFA model equally expressive as the DFA model?

It is not as expressive. Consider the DFA  $Q = (\{q_0, q_1\}, \{0, 1\}, \delta, q_0, \{q_1\})$  with  $\delta(\_, \_) = q_1$  The language of D does not contain  $\epsilon$ , whereas any language recognized by a NEFA must contain  $\epsilon$ , thus they can never be equivalent.

(b) Take 2 DFAs  $D_1$  and  $D_2$ . Now take the language  $L = (L(D_1) \cap L(D_2))^*$ . Is L regular?

We have seen in the book that intersection and the \* operation are closed under the regular languages. So the answer is  $L$  is regular.

## 6 Bonus Exercise
